1756

DATE MAILED: 05/19/2003

Please find below and/or attached an Office communication concerning this application or proceeding.

Office Action Summary

Application No.

09/272,303

Applicant(s)

TOMARU ET AL.

Examiner

Martin J Angebranndt

Art Unit

1756

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If the period for reply specified above is less than thirty (30) days, a reply within the statutory minimum of thirty (30) days will be considered timely.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133).
- Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

- 1) ☒ Responsive to communication(s) filed on 04 March 2003.
- 2a) ☒ This action is **FINAL**. 2b) ☐ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

- 4) ☒ Claim(s) 9 and 11-15 is/are pending in the application.
- 4a) Of the above claim(s) _____ is/are withdrawn from consideration.
- 5) ☐ Claim(s) _____ is/are allowed.
- 6) ☒ Claim(s) 9 and 11-15 is/are rejected.
- 7) ☐ Claim(s) _____ is/are objected to.
- 8) ☐ Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☐ The drawing(s) filed on _____ is/are: a) ☐ accepted or b) ☐ objected to by the Examiner.
- Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
- 11) ☐ The proposed drawing correction filed on _____ is: a) ☐ approved b) ☐ disapproved by the Examiner.
- If approved, corrected drawings are required in reply to this Office action.
- 12) ☐ The oath or declaration is objected to by the Examiner.

Priority under 35 U.S.C. §§ 119 and 120

- 13) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All b) ☐ Some * c) ☐ None of:
1. ☐ Certified copies of the priority documents have been received.
2. ☐ Certified copies of the priority documents have been received in Application No. _____.
3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).
- * See the attached detailed Office action for a list of the certified copies not received.
- 14) ☐ Acknowledgment is made of a claim for domestic priority under 35 U.S.C. § 119(e) (to a provisional application).
- a) ☐ The translation of the foreign language provisional application has been received.
- 15) ☐ Acknowledgment is made of a claim for domestic priority under 35 U.S.C. §§ 120 and/or 121.

Attachment(s)

- 1) ☒ Notice of References Cited (PTO-892)
- 2) ☐ Notice of Draftsperson's Patent Drawing Review (PTO-948)
- 3) ☐ Information Disclosure Statement(s) (PTO-1449) Paper No(s) _____.
- 4) ☐ Interview Summary (PTO-413) Paper No(s). _____.
- 5) ☐ Notice of Informal Patent Application (PTO-152)
- 6) ☐ Other: _____.

Art Unit: 1756

1. The response provided by the applicant has been read and given careful consideration. Responses to the arguments advanced by the applicant are presented after the first rejection to which they are directed. Rejections of the previous office action not appearing below are withdrawn based upon the arguments and amendments of the applicant.

2. Applicant is advised that should claims 9-12 or 13-15 be found allowable, the claims of the other grouping will be objected to under 37 CFR 1.75 as being a substantial duplicate thereof. When two claims in an application are duplicates or else are so close in content that they both cover the same thing, despite a slight difference in wording, it is proper after allowing one claim to object to the other as being a substantial duplicate of the allowed claim. See MPEP § 706.03(k).

The only difference between claims 9 and 13, is that claim 13 states that the composition having a viscosity of 500 to 10,000 cps is a liquid. The viscosity range recited in both claims limits the composition irradiated to a liquid.

3. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

4. Claims 9 and 11-15 are rejected under 35 U.S.C. 103(a) as being unpatentable over Fan et al. EP 0446672, in view of Tsukamoto et al. '715, Ueno et al. JP 09-243869, Watanabe et al. '281 and Elliott, D., "Integrated Circuit Fabrication Technology", pp125-129 (1982).

Tsukamoto et al. '715 teaches the use in the 11th embodiment, the formation of a photosensitive on a substrate followed by imagewise exposure using a mask. The use of epoxy

Art Unit: 1756

compositions is disclosed, including EHPE-3150 which is embraced by formula I (21/43-61). In the case of the cited figures air or the substrate which each have a lower refractive index than the waveguide materials act in place of cladding layers. Photoinitiators useful with epoxies are disclosed. (23/30-67) The use of cladding materials is disclosed. (16/42-47) The use of solvent development is disclosed. (20/29-52). The composition in table 1 contains 33.2% EPHE solids. The use of spin coating is disclosed (18/11-14).

Fan et al. EP 0446672 teaches with respect to figures 3a-e, the coating of a cladding layer, the formation of a waveguiding core using a photosensitive polymer in selected areas and the overcoating with an upper cladding layer. (12/10-44) The cladding layer are disclosed as having a lower refractive index than the waveguiding core. The use of the photosensitive epoxy epirez su8 for the waveguiding core and the use of epoxy functionalized PMMA for the cladding is disclosed. (12/37-40) As discussed in the first example, the use of spin coating for coating the photosensitive waveguiding core and the use of lithographic patterning for the exposure are disclosed (10/40-47, 10/47-53). The use of solvent development to remove undesired photosensitive material to form the ridge core is disclosed. (11/10-19). The teachings with respect to figure 2 are similar, but do not use the solvent development step. The formation of optical waveguides formed from epoxies having waveguiding layers with thicknesses of 50 microns or more is taught. (8/4-5) Example 1 at 13/3-18 has a thickness and width of 50 microns. The use of layers with thicknesses of up to several hundred microns is disclosed. (10/48-50). The use of spin coating is disclosed. (10/40-42).

Art Unit: 1756

Ueno et al. JP 09-243869 teaches in example 1, the formation of a epoxy based resist solution, which is dip coated onto a substrate and then irradiated with a argon ion laser to harden the liquid photoresist solution. [0018-0019].(translation attached)

Watanabe et al. '281 teaches a photoresist solution with a viscosity of 3800 cps which is spin coated at 1000 rpm for 10 seconds yield a thickness of 75 microns. (6/50-56).

Elliott, D., "Integrated Circuit Fabrication Technology", pp125-129 (1982) teaches spin coating techniques for photosensitive resist solutions, the formula indicates that the thickness is a function of rotational speed and solids content (viscosity).

It would have been obvious to one skilled in the art to modify the process of example 1 of Fan et al. EP 0446672 to use other epoxies known to be useful a waveguiding cores, such as the EPHE-3150 composition disclosed in table 1 by Tsukamoto et al. '715 and to develop them using solvents to remove the uncured portions of the epoxy waveguiding layer, such as those taught in Fan et al. EP 0446672 and to use cladding layer below and above the waveguiding core as taught by Fan et al. EP 0446672, based upon the disclosure of equivalence within the references between the solvent development and refractive index distribution techniques and the various waveguiding materials and the direction to the use of cladding layers within Tsukamoto et al. '715, further it would have been obvious to one skilled in the art to spin coat the solution at 1000 rpm to yield a coating sufficiently thick to form a multimode waveguide based upon the teachings of Watanabe et al. '281 and Elliott, D., "Integrated Circuit Fabrication Technology", pp125-129 (1982) for photosensitive photopolymers and to perform the curing without drying the coating to save time with a reasonable expectation of success based upon the disclosure of Ueno et al. JP 09-243869 of the hardening of the liquid epoxy resist without drying.

The examiner notes that the composition in table 1 of Tsukamoto et al. '715 contains 33.2% EPHE solids, which according to table 1 on page 11 of the instant specification has a viscosity in excess of 2000 cps (based upon example 5, in excess of 2500 cps). The examiner holds that the viscosity of the solution is inherently in excess of 2500 cps and within the scope recited in the claims. The use of spin coating techniques is disclosed in both Tsukamoto et al. '715 and Fan et al. EP 0446672 and as such cannot be considered confer novelty or unobviousness. The example of embodiment 5 appears to differ from embodiment 2, in that the width dimension is 8 microns, where in the case of embodiments 1 and 2, the width is 40 and 50 microns respectively and a multimode optical waveguide is produced. Therefore all the dimensions are considered important. Clearly, there is a difference in the refractive index of the cured and uncured portion of the resin of Tsukamoto et al. '715 and there is clearly a difference in the solubility of these areas due to the difference in the degree of crosslinking/polymerization. This is supported by the teachings of Fan et al. EP 0446672. The line of reasoning is now set forth more clearly above. Clearly, the use of epoxy materials for waveguiding core is disclosed in both Tsukamoto et al. '715 and Fan et al. EP 0446672 and the utility of EPHE 3150 as a waveguiding core material is clearly appreciated in the art. Therefore it would have been obvious to one skilled in the art to modify the process of example 1 of Fan et al. EP 0446672 to use other epoxies known to be useful a waveguiding cores, such as the EPHE-3150 composition disclosed in table 1 by Tsukamoto et al. '715 and to develop them using solvents to remove the uncured portions of the epoxy waveguiding layer, such as those taught in Fan et al. EP 0446672 and to use cladding layer below and above the waveguiding core as taught by Fan et al. EP 0446672, based upon the disclosure of equivalence within the references between the solvent

Art Unit: 1756

development and refractive index distribution techniques and the various waveguiding materials and the direction to the use of cladding layers within Tsukamoto et al. '715.

The examiner agrees that the previous combination of references did not render obvious the currently claimed invention, which now limits the exposure to taking place while the mixture containing the reactive oligomer. The previously applied references dry the coating prior to exposure. The addition of Ueno et al. JP 09-243869 addresses that. It is unclear that there is any advantage, other than the obvious time savings, attributable to the curing while in a liquid form. As evidenced by Elliott, D., "Integrated Circuit Fabrication Technology", pp125-129 (1982), the thickness of the resultant spin coating is a function of rotational speed and solids content (viscosity). The curing when dry or wet does not seem to play a function in the resulting thickness as the coatings use the liquid form. The applicant argues that the exposure/curing while wet results in a more uniformly cured product on page 7 of the response, but this does not seem to be supported by any data in the record.

5 Applicant's amendment necessitated the new ground(s) of rejection presented in this Office action. Accordingly, **THIS ACTION IS MADE FINAL**. See MPEP § 706.07(a). Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire THREE MONTHS from the mailing date of this action. In the event a first reply is filed within TWO MONTHS of the mailing date of this final action and the advisory action is not mailed until after the end of the THREE-MONTH shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event,

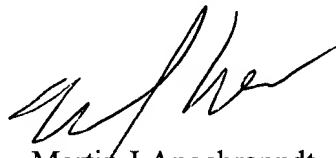

Art Unit: 1756

however, will the statutory period for reply expire later than SIX MONTHS from the date of this final action.

6 Any inquiry concerning this communication or earlier communications from the examiner should be directed to Martin J Angebranntt whose telephone number is 703-308-4397. The examiner can normally be reached on Mondays-Thursday and alternative Fridays.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Mark Huff can be reached on 703-308-2464. The fax phone numbers for the organization where this application or proceeding is assigned are 703-305-3599 for regular communications and 703-305-3599 for After Final communications.

Any inquiry of a general nature or relating to the status of this application or proceeding should be directed to the receptionist whose telephone number is 703-308-0661.
